Scientific Dossier & Pharmacovigilance Risk Assessment

EVALUATED REGIMEN: WARFARIN SODIUM + ASPIRIN

SEVERITY: MAJOR ADVERSE INTERACTION

Mechanism: Warfarin depletes vitamin K-dependent procoagulant factors (II, VII, IX, X). Aspirin irreversibly acetylates platelet COX-1 suppressing TXA2, disrupting primary platelet plugs, plus gastric mucosal erosion. Synergistic disruption of primary hemostasis and secondary coagulation cascade results in high bleeding risk.
